

PARTNERSHIP ECOSYSTEM

Make Proactive Public Health Decisions With Unique Data from Appriss Health and hc1

Today's local and state governments are fighting the ongoing opioid epidemic from behind. Decision-makers only have access to old data, and many times this data is hard to find and manipulate. Healthcare and government teams are stuck compiling subsets of usable data manually, forcing reactive strategies and decisions. Appriss Health, a leading PDMP provider, and hc1.com, the world leader in diagnostic result insights, have partnered to make it easy for public health influences to access timely data and insight that is completely unique to the space.

Together, the insight available through Appriss Health's extensive PDMP data lake for 42 states and hc1.com's own data set of live positivity results from over 5 billion diagnostic tests create a unique view of patient care that has thus far eluded healthcare and government officials alike. Visualizing historical patient prescription data alongside real-time test results enables healthcare and legislative decision-makers to take proactive action and combat the opioid epidemic.

While many states have access to segmented PDMP data, there is no way visualize this prescription data alongside actual patient results data. With these insights available side-by-side, state government and healthcare organizations can create aggressive, data-backed strategy to fight the opioid crisis.

Positively Impacting the U.S. Opioid Crisis

As the opioid epidemic grows to overwhelming levels, government organizations can no longer settle for reactive strategies and focus. With the Appriss Health and hc1 partnership, decision-makers have immediate access to diagnostic positivity rates alongside the actual prescription data on a statewide level to target any problem areas. This

allows organizations to break down opioid abuse trends by demographic, region, and even behavioral context to make more informed decisions in the proactive fight against opioid abuse.

Enabling Physicians to Make Better Prescription Decisions

Down the line, the Appriss Health and hc1 partnership will adequately prepare physicians to make better decisions around patient health and prescriptions. In today's siloed healthcare environment, it's hard for even physicians to truly know what exactly a patient has been prescribed. The Appriss Health and hc1 partnership puts this data in the hands of physicians, giving them a real-time look at patient results, past prescriptions, and more.

How it Works

The Appriss Health's PDMP platform, PMP Aware, provides access to mandatory pharmacy reporting with secure accessibility to data across state lines. The hc1 platform is a secure, HIPAA-approved environment used by over 1,000 laboratory locations across the country to monitor and manage diagnostic test results in real-time. hc1 has built a unique dashboard that combines de-identified test result outcomes with the PDMP data sets from Appriss Health in a single, easily accessible location.
